Allegati

1.N – Scenario 1

- 1.1 – Profilo idrometrico Q 50
- 1.2 – Profilo idrometrico Q 200
- 1.3 – Profilo idrometrico Q 500
- 1.4 – Sezioni con livelli idrometrici – da 39 a 18
- 1.5 – Sezioni con livelli idrometrici – da 17.5 a 0
- 1.6 – Tabelle riassuntive

2.N – Scenario 2

- 2.1 – Profilo idrometrico Q 50
- 2.2 – Profilo idrometrico Q 200
- 2.3 – Profilo idrometrico Q 500
- 2.4 – Sezioni con livelli idrometrici – da 39 a 18
- 2.5 – Sezioni con livelli idrometrici – da 17.5 a 0
- 2.6 – Tabelle riassuntive

Premesse

Il presente documento costituisce integrazione alla Relazione Tecnica (Elaborato A) in quanto delinea gli scenari di progetto conseguenti alle possibili soluzioni progettuali illustrate al paragrafo 9 del documento.

Per ogni scenario sono state definite le più probabili perimetrazioni delle aree inondabili (fenomeno fisico) e conseguentemente sono state definite le relative fasce di inondabilità, ossia le carte tematiche riportanti il regime vincolistico del territorio soggetto a pericolosità idraulica.

1 – Scenari Progettuali

1.1 Scenario 1

Lo scenario progettuale 1 corrisponde all'esecuzione degli interventi 1 e 2 descritti al punto 9.1 dell'Elaborato A. Si ipotizza pertanto di eliminare la traversa fluviale (Intervento 1) e di adeguare al franco geometrico l'insufficienza spondale destra tra le sezioni 11 e 12 (Intervento 2). L'intervento si configura quale miglioramento idraulico dal momento che il franco cinetico non risulta sempre rispettato ed il sopralzo spondale destro necessario per egualizzare ovunque la quota dei carichi totali implicherebbe il superamento della corrispondente quota spondale sinistra, costituita da un paramento murario oggettivamente non soprelevabile, da cui la scelta proposta.

Con gli stessi parametri fisici delle modellazioni descritte ed analizzate nella relazione tecnica è stato modellato lo stato di progetto, il cui rapporto delle simulazioni idrauliche è contenuto negli allegati alla presente relazione integrativa. Tali documenti illustrano i principali risultati della modellazione idraulica eseguiti nelle ipotesi di portata cinquantennale, duecentennale e cinquecentennale. Con riferimento alle tavole grafiche per lo schema planimetrico del modello (tavv 02 e 03), sono stati quindi riportati:

- il profilo longitudinale (*Allegati 1.1, 1.2 e 1.3*);
- le sezioni trasversali con il livello idrometrico delle portate considerate (*Allegati 1.4 e 1.5*);
- la tabella riassuntiva con i risultati della modellazione (*Allegato 1.6*).

1.2 Scenario 2

Lo scenario progettuale 2 corrisponde all'esecuzione degli interventi 3 e 4 descritti al punto 9.1 dell'Elaborato A. Si ipotizza pertanto di eliminare la passerella pedonale 14.5 (Intervento 3) e di eliminare la passerella carrabile 34.5 (Intervento 4) o di sostituirla con nuovo manufatto in condizioni di adeguatezza idraulica. Anche per questo scenario gli interventi si configurano quali miglioramenti idraulici dal momento che il franco cinetico non risulta sempre rispettato ed i sopralzi

spondali necessari per eguagliare ovunque la quota dei carichi totali implicherebbero modifiche spondali talvolta incompatibili con lo stato esistente, in un contesto in cui peraltro ulteriori insufficienze spondali presenti ad esempio a monte della passerella 34.5, dovute alla mancanza del franco cinetico, vanificherebbero gli ingenti sforzi economici che gli adeguamenti idraulici comporterebbero.

Con gli stessi parametri fisici delle modellazioni descritte ed analizzate è stato modellato lo stato di progetto, il cui rapporto delle simulazioni idrauliche è contenuto negli allegati alla presente relazione integrativa. Tali documenti illustrano i principali risultati della modellazione idraulica eseguiti nelle ipotesi di portata cinquantennale, duecentennale e cinquecentennale. Con riferimento alle tavole grafiche per lo schema planimetrico del modello (tavv 02 e 03), sono stati quindi riportati:

- il profilo longitudinale (*Allegati 2.1, 2.2 e 2.3*);
- le sezioni trasversali con il livello idrometrico delle portate considerate (*Allegati 2.4 e 2.5*);
- la tabella riassuntiva con i risultati della modellazione (*Allegato 2.6*).

2 – Perimetrazione delle aree inondabili

La determinazione delle aree inondabili, distinta per scenari di intervento, è stata effettuata valutando le criticità idrauliche residue e considerando le potenziali esondazioni per superamento delle quote arginali. La perimetrazione delle aree è stata stimata mediante elaborazioni essenzialmente basate su criteri topografici, con sopralluoghi mirati alla determinazione dei possibili percorsi idrici di superficie a maggiore gradiente idraulico.

Tale procedura, aderente al fenomeno fisico dell'inondazione reale, rappresenta tuttavia l'estremo superiore dei possibili scenari di inondazione, dal momento che il tipo di modello utilizzato prescinde dalla conoscenza dei reali volumi esondati.

La tavola 06 illustra l'esito della procedura sopra utilizzata per lo scenario 1.

La tavola 08 illustra l'esito della procedura sopra utilizzata per lo scenario 2.

3 – Fasce di Inondabilità

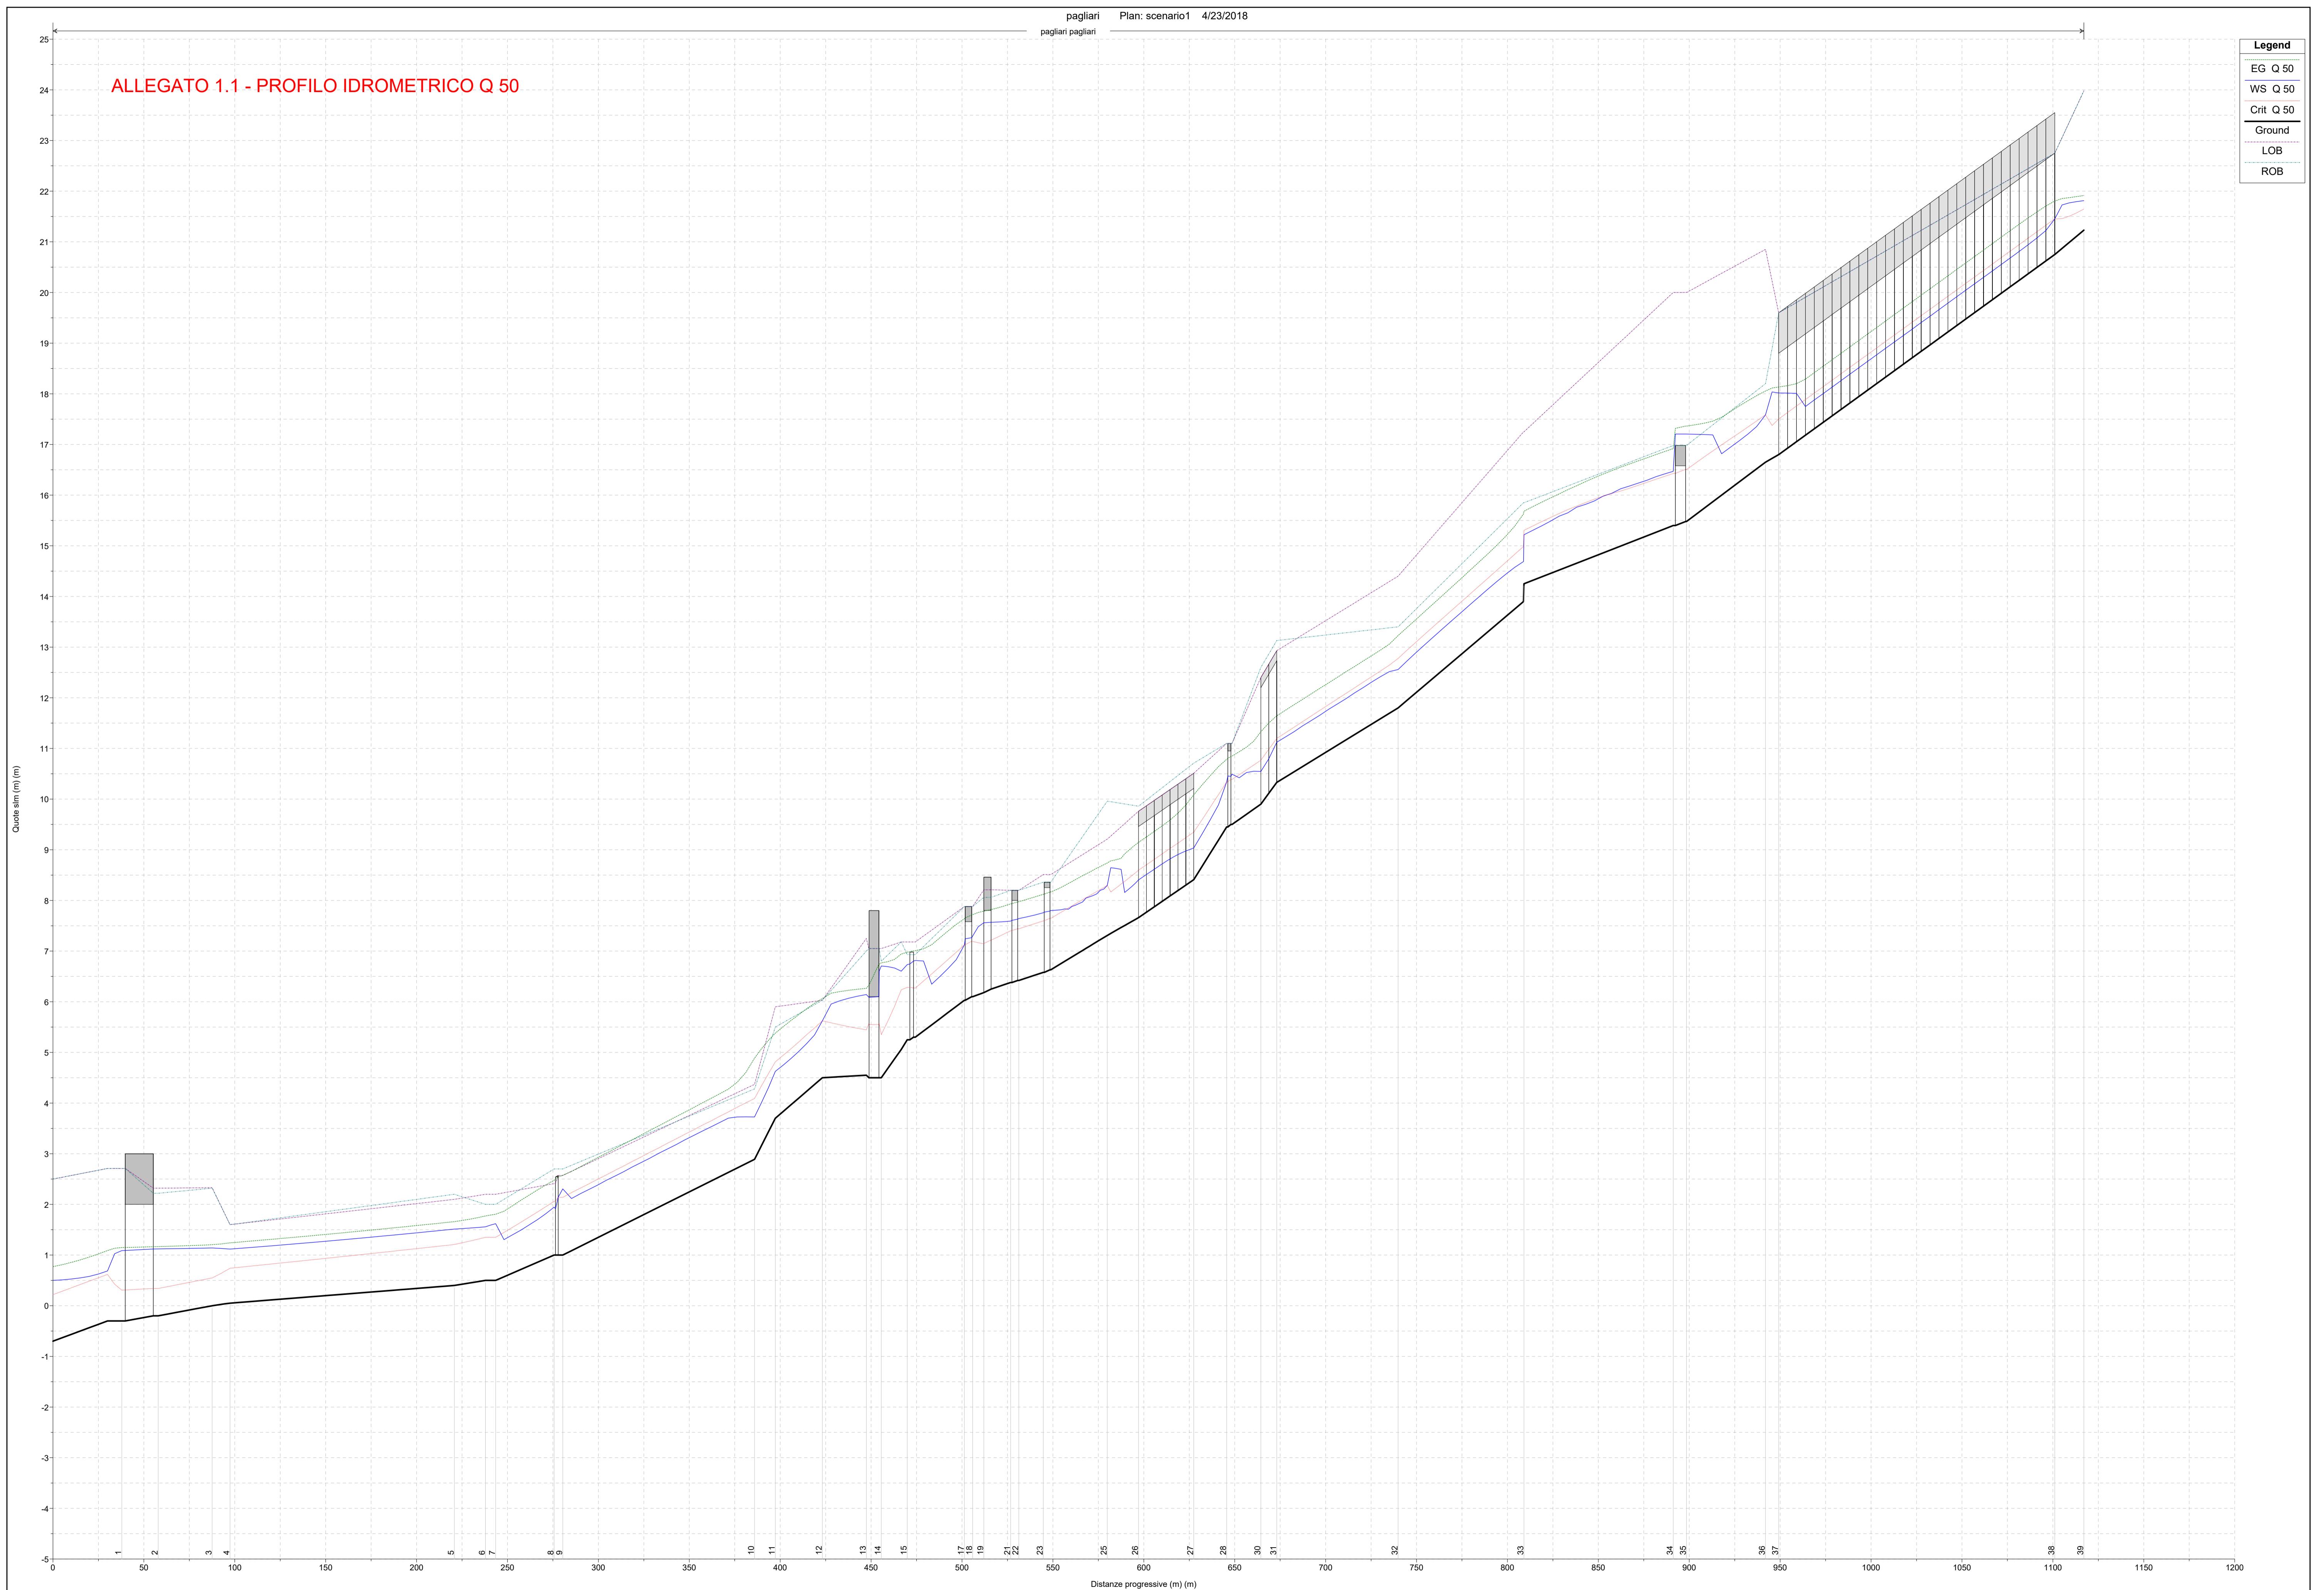

Sulla base della carta delle aree inondabili, che rappresenta una stima del fenomeno fisico di trasferimento a valle delle portate idriche associato alle aree bagnate da fenomeni di insufficienza idraulica, è stata redatta la carta delle fasce di inondabilità, elaborato grafico che estende il regime vincolistico proprio delle aree inondabili anche a territori che si ritiene prudente perimetrire come tali, in ragione ad esempio del mancato raggiungimento dei franchi idraulici, di condizioni di cautela

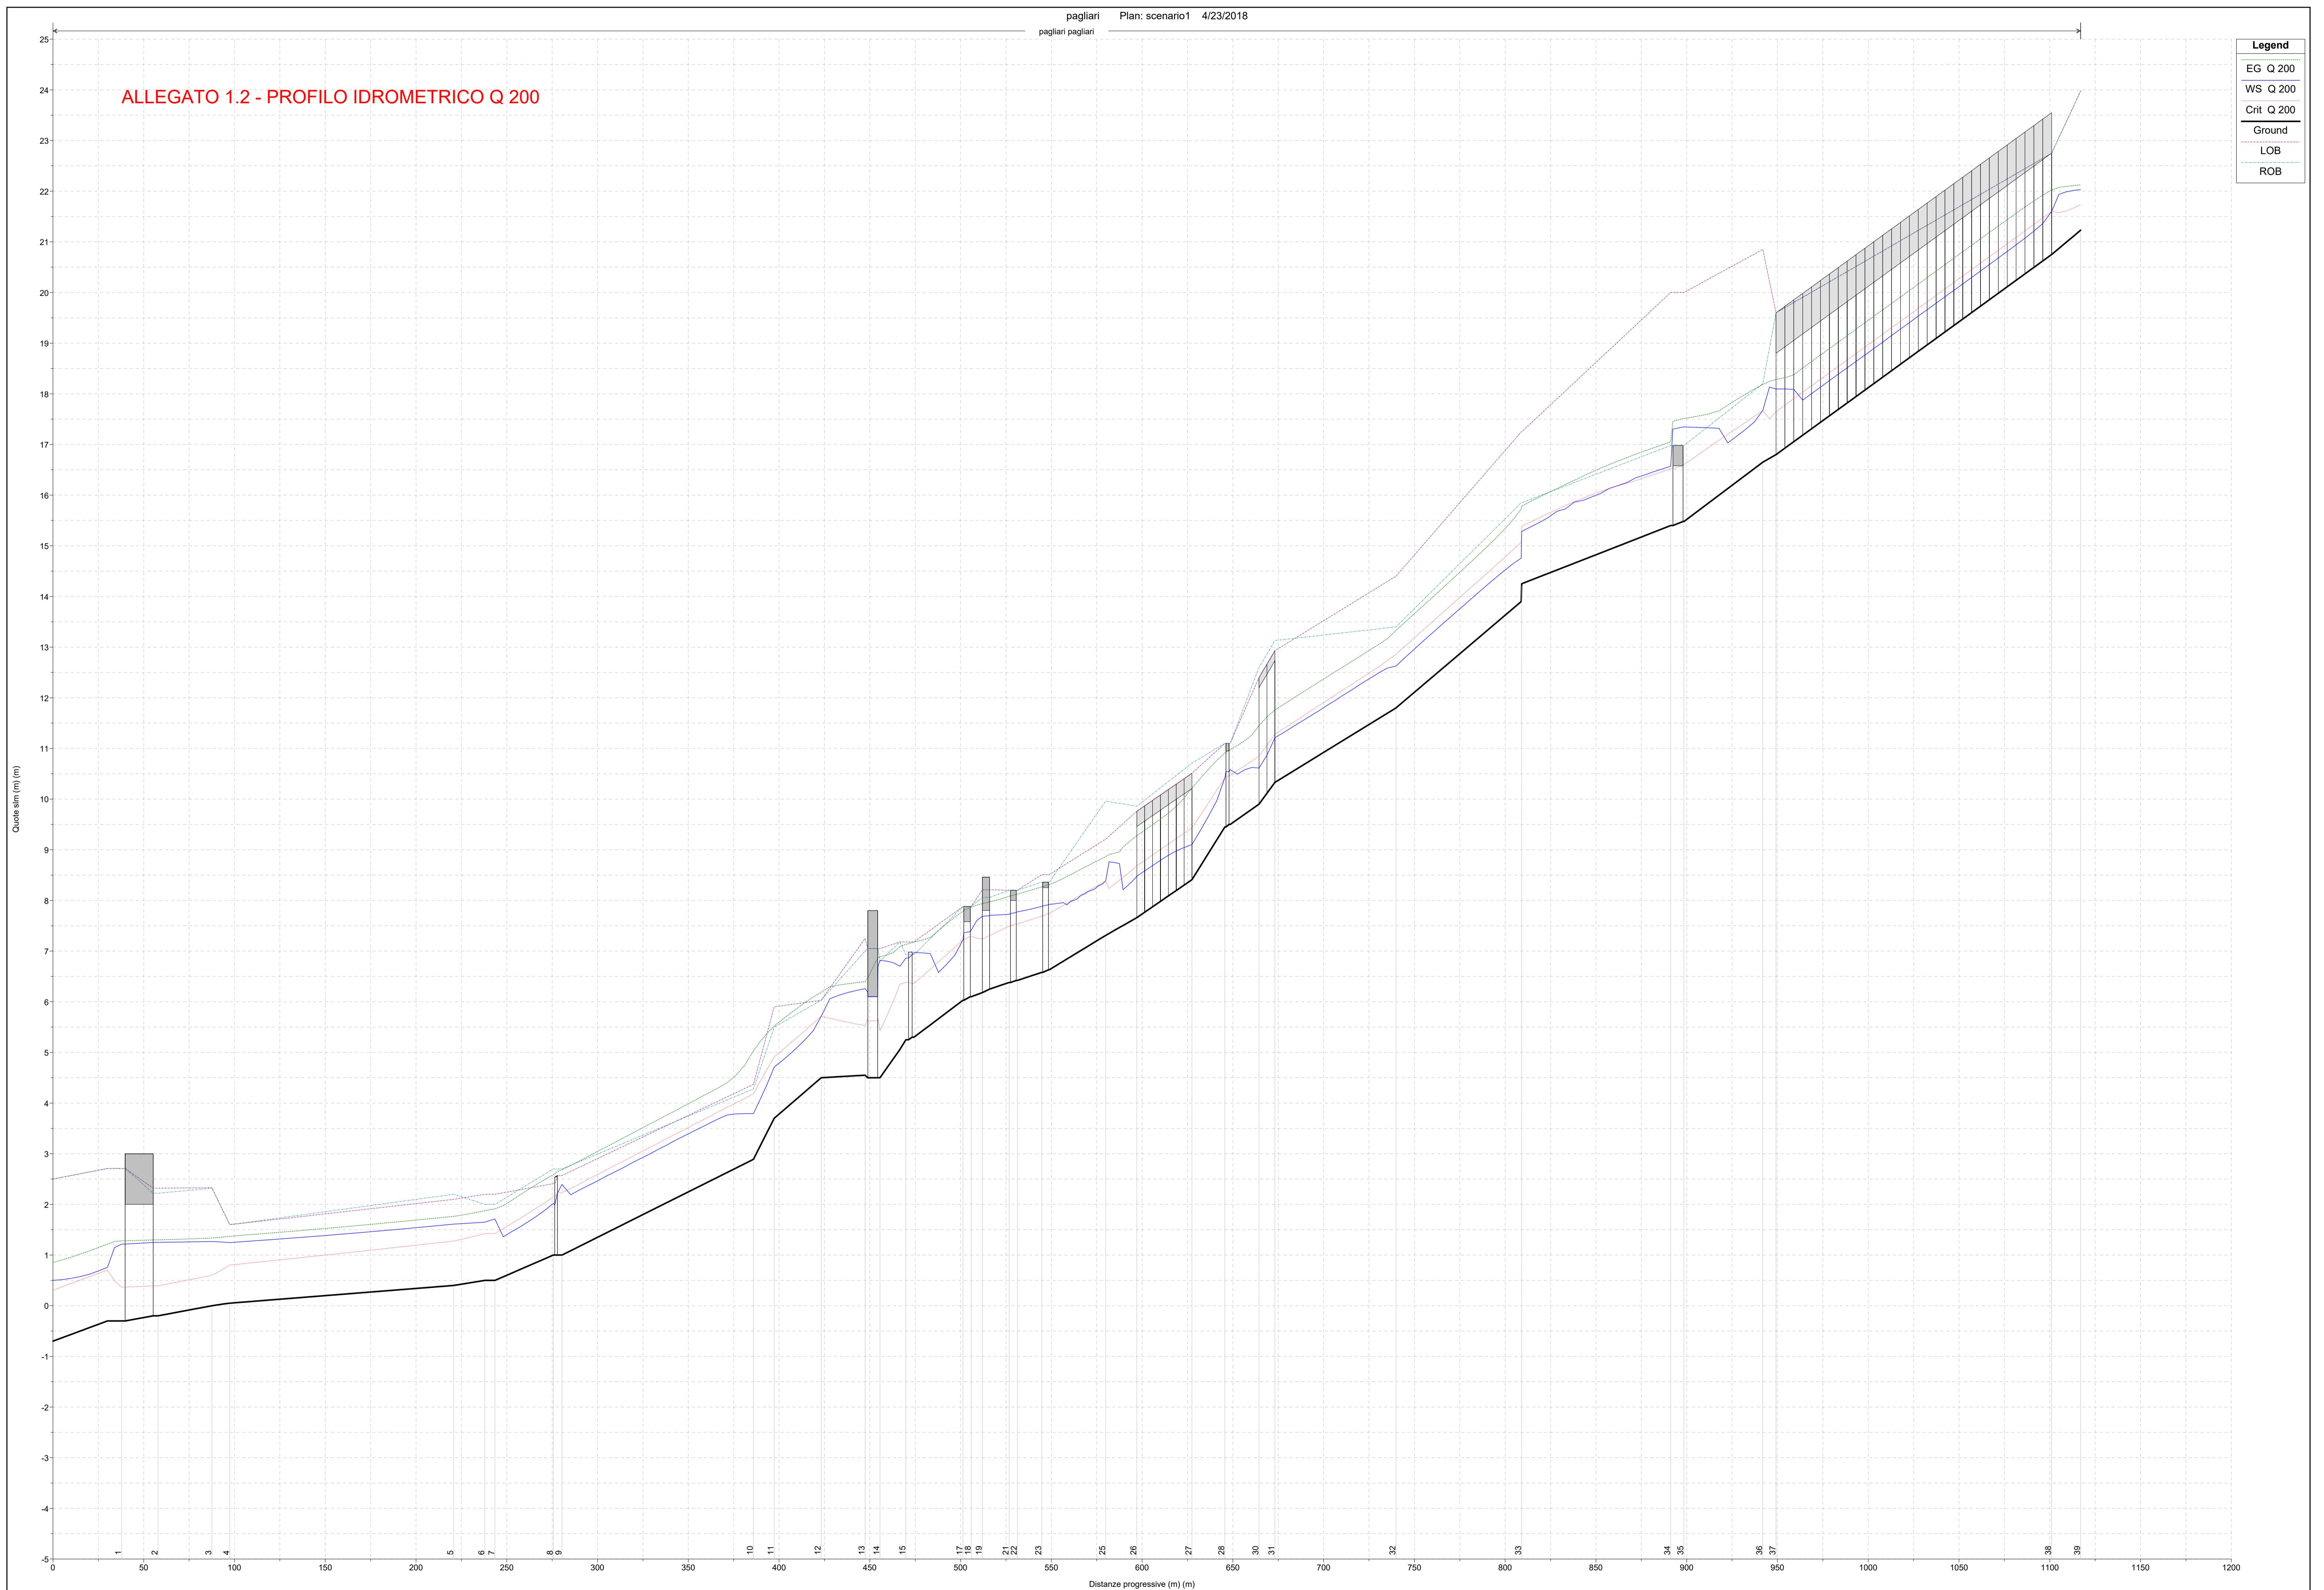

per assenza di vie di esodo sicuro oppure per scongiurare l'eventualità che trasformazioni antropiche possano condurre all'estensione delle aree inondabili stesse.

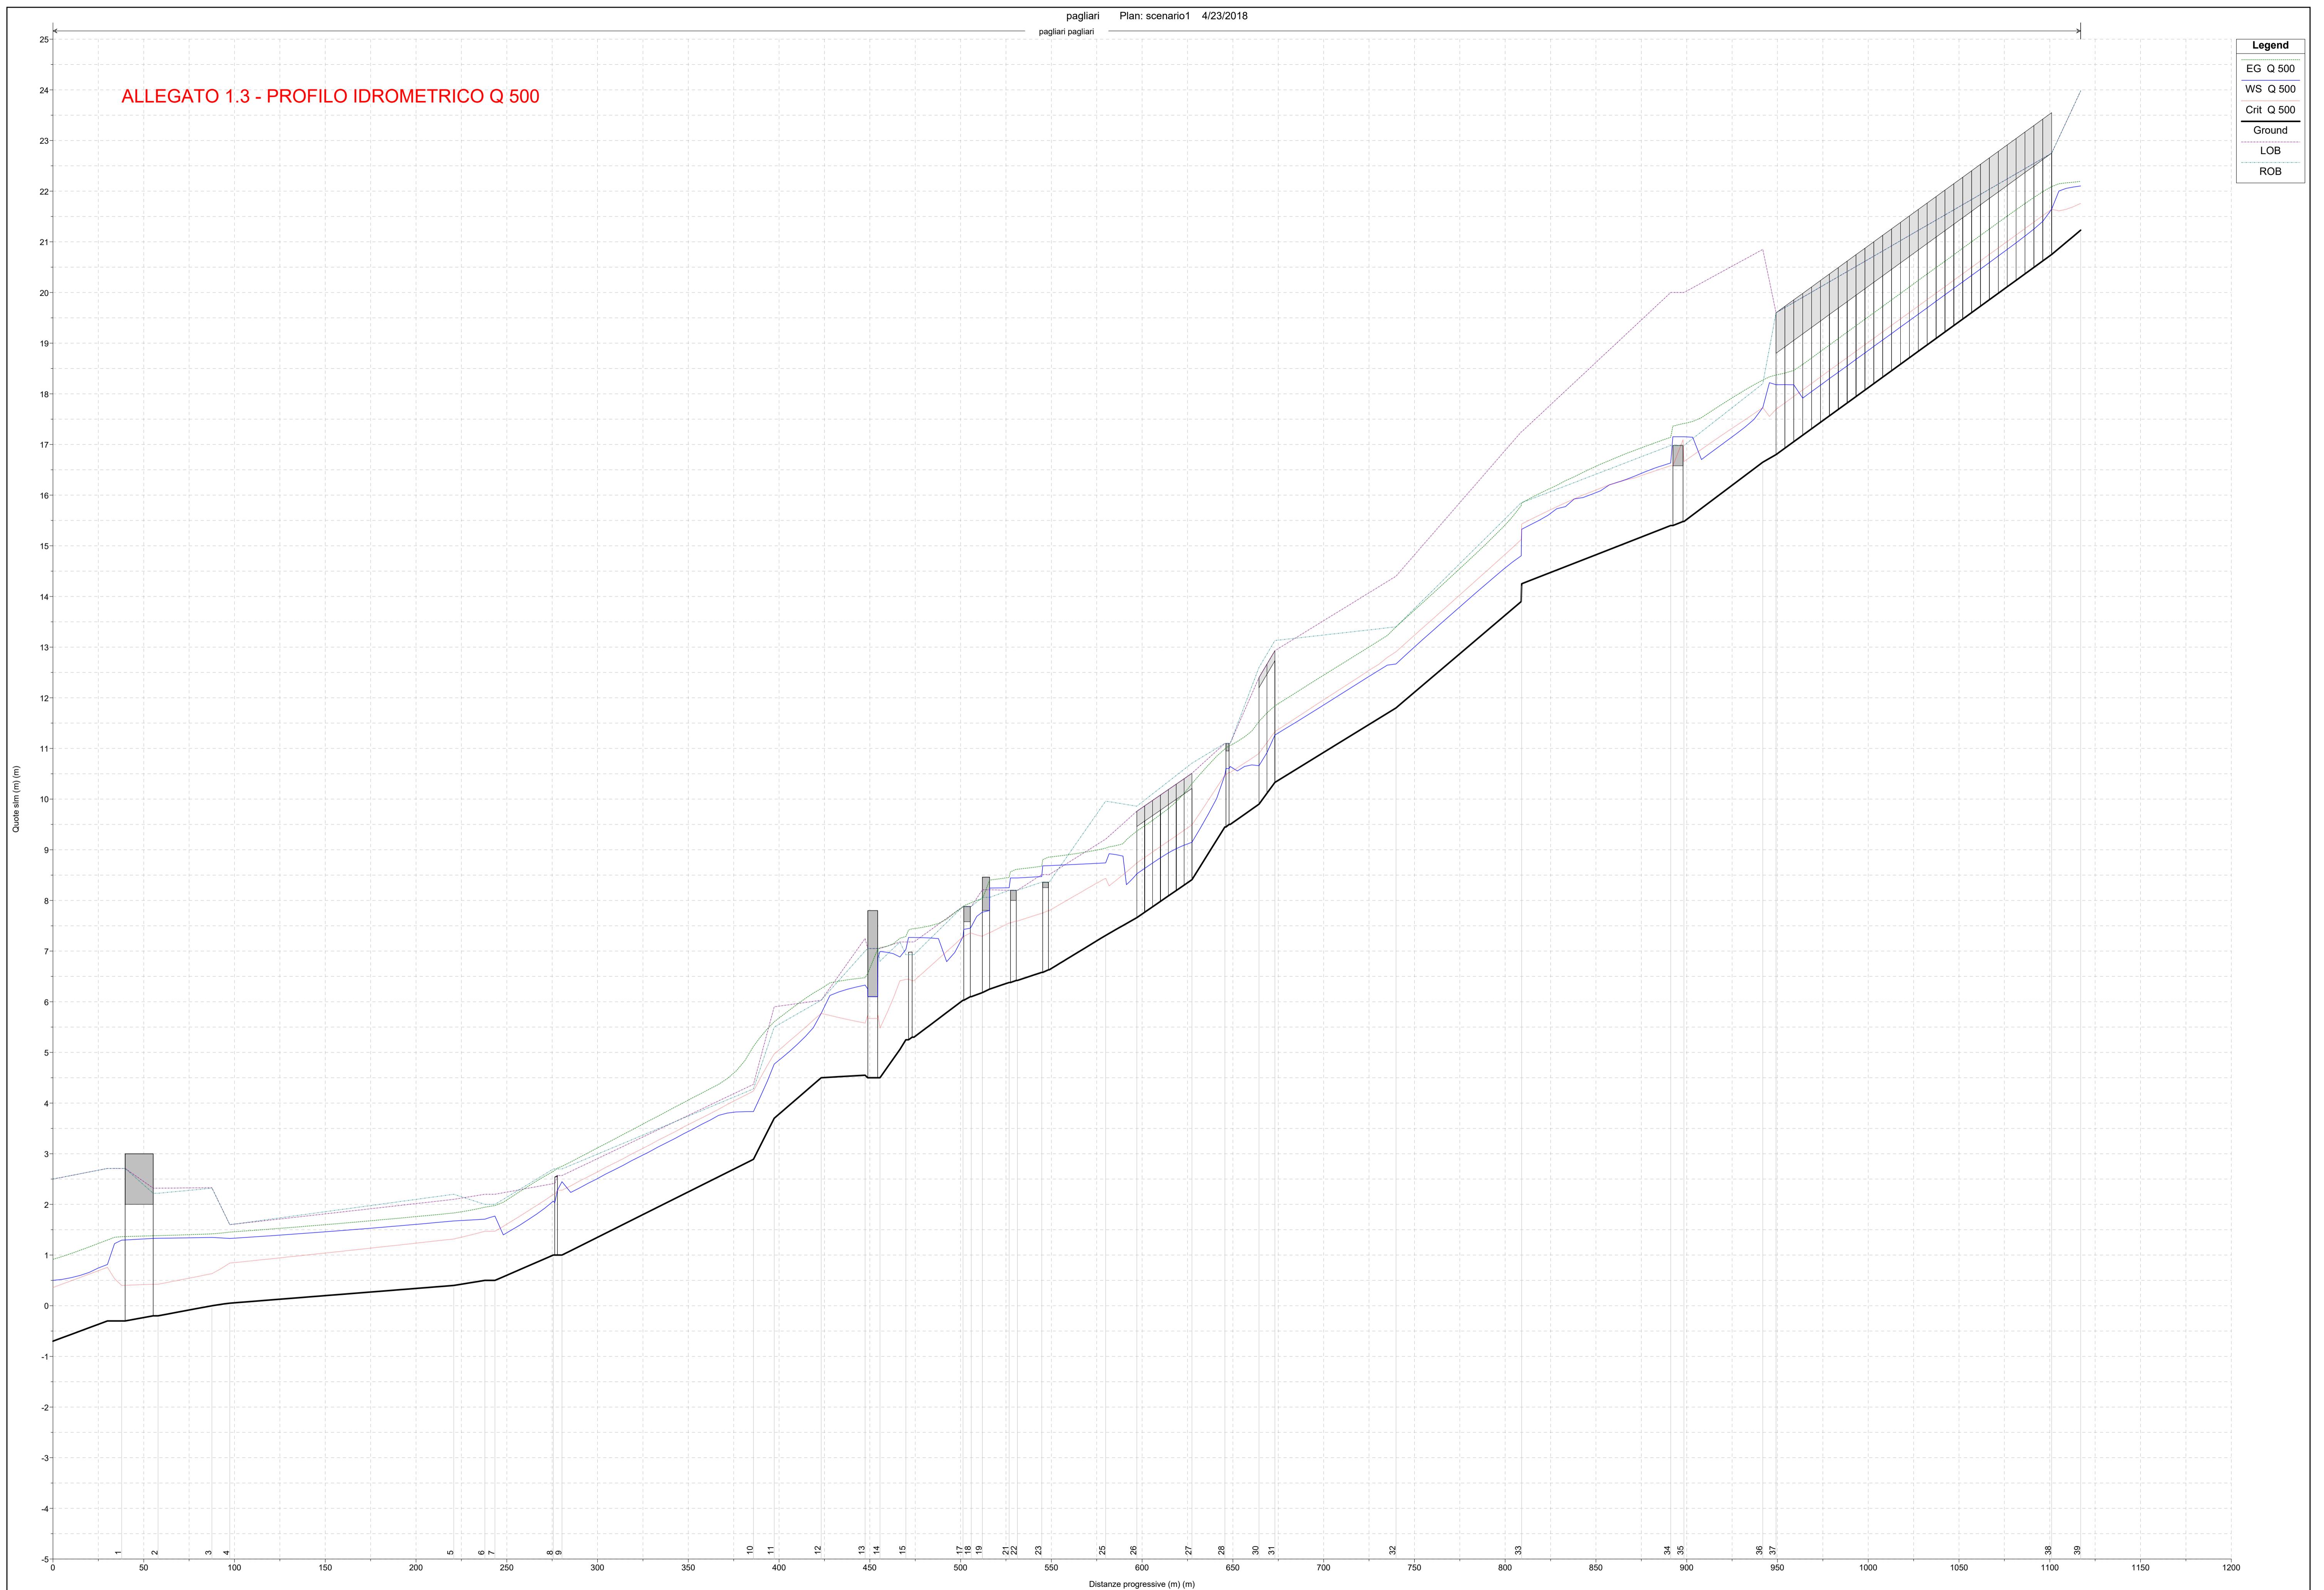

Laddove le insufficienze idrauliche dovute alla mancanza di franco (principalmente cinetico) abbiano consigliato una perimetrazione di aree inondabili a tirante nullo, per assenza di fenomeno fisico di inondazione, è stata proposta l'attribuzione di fascia a minor pericolosità, ai sensi dell'art 15 della normativa di Piano.

La tavola 07 illustra l'esito della procedura sopra utilizzata per lo scenario 1.

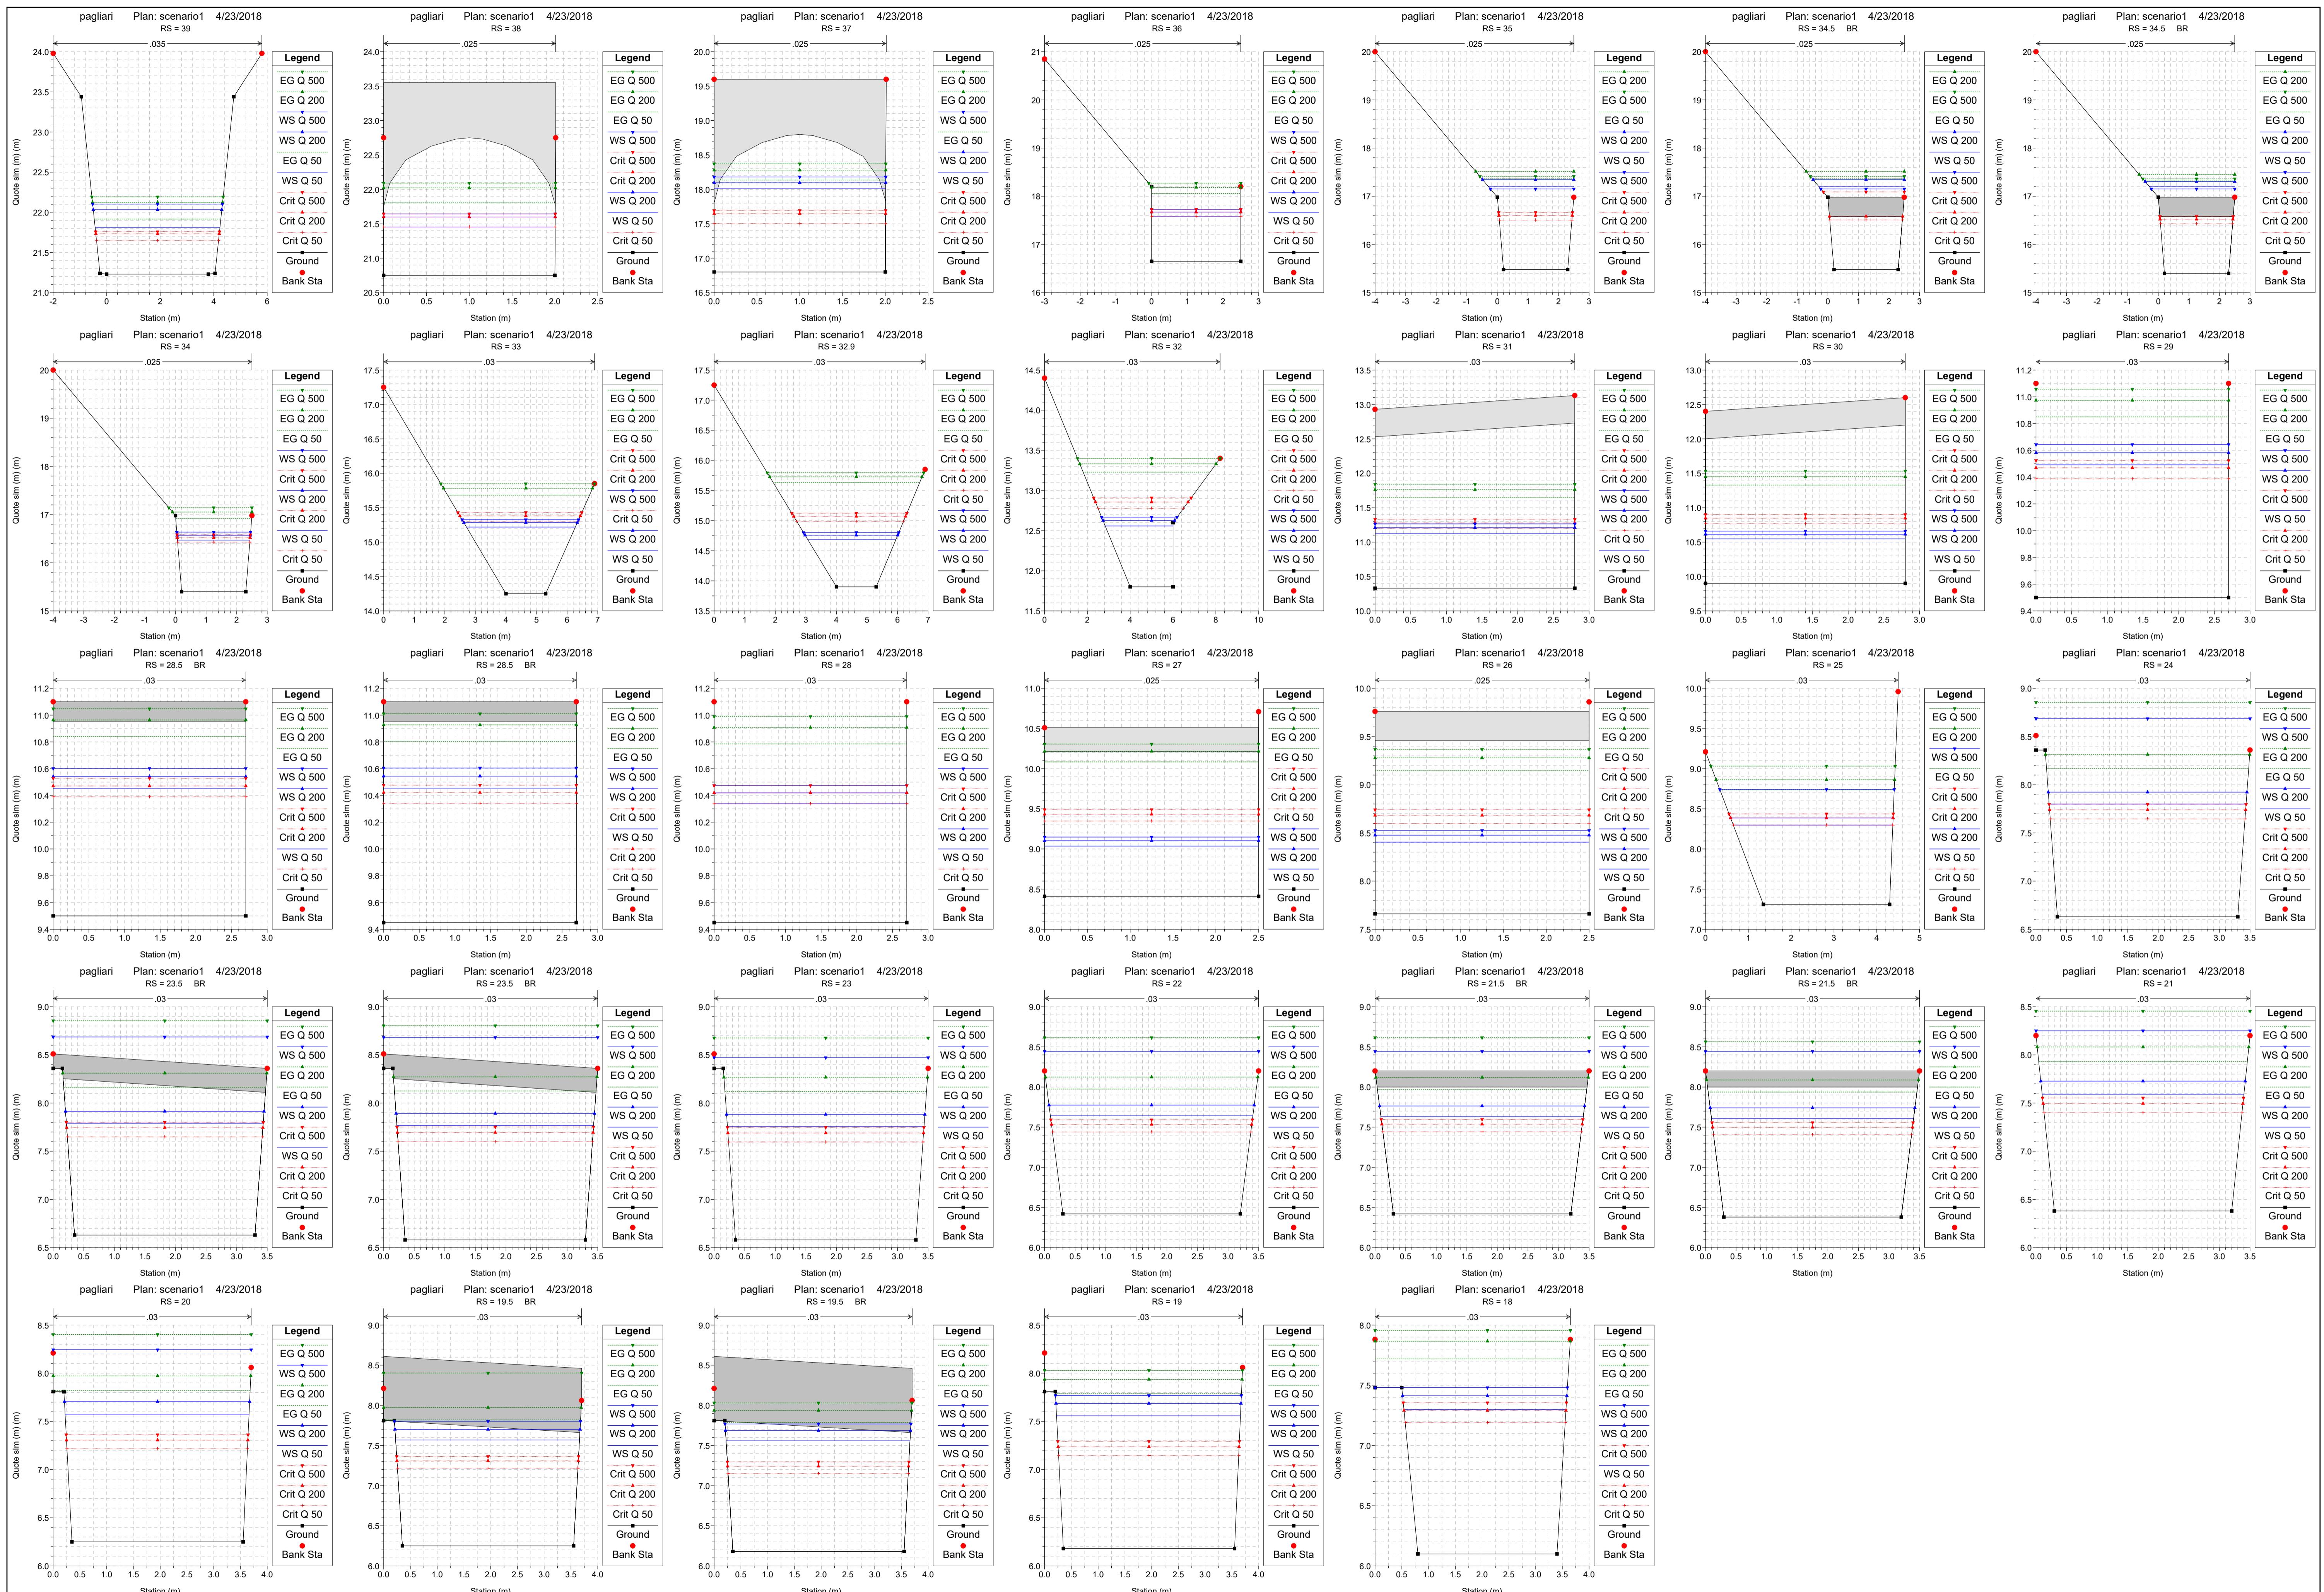

La tavola 09 illustra l'esito della procedura sopra utilizzata per lo scenario 2.
